Please find below and/or attached an Office communication concerning this application or proceeding.

Commissioner of Patents and Trademarks

A	Application No.	Applicant(s)	
	09/033,222	HOGG ET AL.	
Office Action Summary	Examiner	Art Unit	
•	Jeffrey A. Shapiro	3651	
The MAILING DATE of this communication app		correspondence address	
Period for Reply			
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. - If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely. - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). - Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b). Status			
1) Responsive to communication(s) filed on 02 I	March 1998 .		
2a) ☐ This action is FINAL . 2b) ☑ Th	is action is non-final.		
3) Since this application is in condition for allowance except for formal matters, prosecution as to the ments is closed in accordance with the practice under <i>Ex parte Quayle</i> , 1935 C.D. 11, 453 O.G. 213.			
Disposition of Claims			
4) Claim(s) <u>1-20</u> is/are pending in the application.			
4a) Of the above claim(s) is/are withdrawn from consideration.			
5) Claim(s) is/are allowed.			
6)⊠ Claim(s) <u>1-20</u> is/are rejected.			
7) Claim(s) is/are objected to.			
8) Claim(s) are subject to restriction and/or election requirement.			
Application Papers			
9)☐ The specification is objected to by the Examiner.			
10) ☐ The drawing(s) filed on is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.			
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).			
11)☐ The proposed drawing correction filed on is: a)☐ approved b)☐ disapproved by the Examiner.			
If approved, corrected drawings are required in reply to this Office action.			
12) The oath or declaration is objected to by the Examiner.			
Priority under 35 U.S.C. §§ 119 and 120			
13) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).			
a) All b) Some * c) None of:			
1. Certified copies of the priority documents have been received.			
2. Certified copies of the priority documents have been received in Application No			
 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)). * See the attached detailed Office action for a list of the certified copies not received. 			
14) Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).			
a) ☐ The translation of the foreign language provisional application has been received. 15)☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Art Unit: 3651

DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 2. Claims 1, 7 and 8 are rejected under 35 U.S.C. 102(b) as being anticipated by Fujita et al (IEEE document dated 1994). Fujita et al discloses the transport assembly as follows.

As described in Claims 1, 7, 8 and 15;

- 1. sensor units and actuator units arranged on the transport assembly;
- 2. said sensor units for providing positional information of the object;
- 3. said actuator units (see "logic circuit" in figure 1) for moving the object relative to the transport assembly (see figure 2);
- 4. local computational agents coupled to said sensor units and said actuator units;
- each of said computational agents accumulating sensor information
 from a spatially localizing grouping of sensor units;
- 6. a global controller, coupled to said local computational agents, for receiving aggregate operating characteristics from, and delivering global constraints to, said local computational agents (see abstract);

Application/Control Number: 09/033,222 Page 3

Art Unit: 3651

 said local computational agents using the global constraints and the sensor information to determine adjustments to said actuator units to

move the object along the transport assembly;

As described in Claim 7;

13. neighboring ones of said sensor units and said actuator units are

coupled to computational agents that communicate directly with each

other (see figure 1);

As described in Claim 8;

14. said actuator units are spatially proximate to each other and ones

of said sensor units (see figure 1);

As described in Method Claim 15;

21. computing a local actuator response for accumulated sensor

information from a spatially localized grouping of sensors;

22. computing a global actuator response for detected global

constraints from the global controller;

23. computing a desired actuator response for minimizing differences

between the computed local actuator response and the computed global

actuator response;

24. applying the desired actuator response to a spatially localized

grouping of actuator units;

Claim Rejections - 35 USC § 103

Page 4

Application/Control Number: 09/033,222

Art Unit: 3651

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 2-6, 9-14 and 16-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fujita et al in view in view of Keeler et al.

Fujita et al discloses the transport apparatus described above. Keeler et al discloses the following.

As described in Claims 2 and 20;

8. a lookup table for communicating the global constraints to said local computational agents (10) (see figure 1);

As described in Claim 3:

9. a filter unit (see figure 7a) for computing the aggregate operating characteristics after receiving the sensor information from the local computational units;

As described in Claim 4;

10. said global controller (24) receives the aggregate operating characteristics over a first operating interval;

As described in Claim 5:

11. said global controller (24) delivers the global constraints over a second operating interval;

As described in Claim 6;

12. the second operating interval is longer than the first operating interval (note that the operating intervals are a function of design choice and would be adjusted to be able to accommodate the specific case);

As described in Claim 9;

15. said local computational agents compute a global response using the global constraints (see figure 7a);

As described in Claim 10;

16. said local computational agents compute a local response with the sensor information (see figure 15);

As described in Claim 11;

17. said local computational agents determine adjustments to said actuator units with a desired actuator response computed using the global response and the local response (see figure 15);

As described in Claim 12;

18. said local computational agents rank the global response and the local response in importance using weights (see col. 10, lines 50-67 and col. 11, lines 1-6);

As described in Claim 13;

19. said local computational agents adaptively determine values for the weights (see col. 10, lines 50-67 and col. 11, lines 1-6);

As described in Claim 14;

Art Unit: 3651

20. said local computational agents and said global controller are organized hierarchically (see figure 1);

As described in Method Claim 16;

25. modifying the desired actuator response to compensate for malfunctioning actuators; (Note that it is inherent that the adaptive control system of Keeler et al in combination with the microactuator array of Fujita et al is able to compensate for malfunctioning or missing actuators.)

As described in Method Claim 17;

26. said modifying step compares the desired actuator responses of computational agents coupled to spatially localized groupings of sensors and actuators (see figures 5, 6, 12 and 15);

As described in Method Claim 18;

27. said modifying step compares the local actuator response of computational agents coupled to spatially localized groupings of sensors and actuators (see figures 5, 6, 12 and 15);

As described in Method Claim 19;

28. determining whether spatially localized groupings of sensor and actuator units function properly (again, note that it is inherent that the adaptive control system of Keeler et al is able to detect groups of sensors and actuators and determine their functional capabilities based on their output—see also figures 5, 6, 12 and 15);

Art Unit: 3651

Both Fujita et al and Keeler et al are analogous art because they concern distributed control. (See abstracts of Fujita et al and Keeler et al.)

At the time of the invention, it would have been obvious to a person of ordinary skill in the art to have used the distributive control system of Keeler et al to control the microactuator arrays of Fujita et al.

The suggestion/motivation for doing so would have been to distributively control the microactuator arrays of Fujita. (See abstract of Fujita et al.)

Therefore, it would have been obvious to combine Fujita et al with Keeler et al to obtain the invention as specified in Claims 2-6, 9-14 and 16-20.

Double Patenting

5. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970);and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

6. Claim 1-20 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over Claims 1-20 of U.S. Patent No. 6,119,052. Although the conflicting claims are not identical, they are not patentably distinct from

Art Unit: 3651

each other because they both describe a distributed control system for controlling microactuator arrays to transport sheets.

Claim 1-20 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over Claims 1-6 of U.S. Patent No. 5,634,636.

Although the conflicting claims are not identical, they are not patentably distinct from each other because they both describe a distributed control system for controlling microactuator arrays to transport sheets.

Claim 1-20 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over Claims 1-20 of U.S. Patent No. 6,039,316.

Although the conflicting claims are not identical, they are not patentably distinct from each other because they both describe a distributed control system for controlling microactuator arrays to transport sheets.

Claim 1-20 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over Claims 1-20 of U.S. Patent No. 6,027,112.

Although the conflicting claims are not identical, they are not patentably distinct from each other because they both describe a distributed control system for controlling microactuator arrays to transport sheets.

Conclusion 1

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
